

Python program

Digital Wallet Balance

```
basic_salary=int(input())
allowance=int(input())
bonus=int(input())

total_salary=basic_salary+allowance+bonus
print("total salary : ",total_salary)
```

Product Billing

```
price=int(input())
quantity=int(input())
discount=int(input())
final_amount=price+quantity-discount
print(final_amount)
```

Three-Digit Number Analysis

```
number = int(input())
hundreds = number // 100
tens = (number // 10) % 10
units = number % 10
digit_sum = hundreds + tens + units
print(hundreds)
print(tens)
print(units)
print(digit_sum)
```

Mobile Data Usage

```
data_usage = int(input())
gigabytes = data_usage // 1024
remaining_mb = data_usage % 1024
print(gigabytes)
print(remaining_mb)
```

File Size Analyzer

```
bytes_size = int(input())
kilobytes = bytes_size // 1024
remaining_bytes = bytes_size % 1024
print(f"Size: {kilobytes} KB Remaining: {remaining_bytes} bytes")
```

Cab Fare Calculator

```
name = input()
distance = float(input())
rate = float(input())
waiting_fee = float(input())
discount = float(input())
distance_charge = distance * rate
final_fare = distance_charge + waiting_fee - discount
print(f"Passenger: {name}")
print(f"Final Fare: {final_fare:.2f}")
```

Employee Salary Calculation

```
basic_salary=int(input())
allowance=int(input())
```

```
bonus=int(input())
```

```
total_salary=basic_salary+allowance+bonus
```

```
print("total salary : ",total_salary)
```
